International Workshop on Ubiquitous Access Control

http://netgroup.uniroma2.it/Stefano_Salsano/IWUAC-06/

To be held in conjunction with:
The 3rd Annual International Conference on Mobile and Ubiquitous Systems: Networks and Services (MOBIQUITOUS 2006)
http://www.mobiquitous.org/
July 17-21, 2006 - San Jose, California, USA

=======================================================================

Important Dates

Paper Submission Deadline: April 10, 2006
Notification of Acceptance: May 10, 2006
Camera-Ready Submissions: May 30, 2006

(Accepted papers will be published in the conference proceedings and the IEEE Digital Library)

=======================================================================

Background

The access to resources or services located in “foreign” environments and owned by disparate entities is a painful process for mobile users. This is a significant deterrent to the ability to easily interconnect in a secure and spontaneous manner among disparate organizations. In fact, corporate wireless networks are generally run with severe access policies that do not offer access to guests. Public wireless networks typically do not support roaming agreements, so that users have to be a customer of the specific network provider or to “instantly” (and costly) buy access.

Coalition access control encompasses mechanisms dealing with access between users and services of two or more different security domains. These mechanisms are typically based on contractually or implicitly agreed collaboration between organizations. They are targeted to medium or long-term periods of inter-organizational coalition. Some real examples are supply chain management, international joint projects, logistics service, etc. The overhead to set up these mechanisms can be significant, as the access control mechanisms for resources of the participating partners require common inter-organizational agreements. The inter-provider agreements that allow users to roam across different wireless providers can be seen as a form of coalition access control. Work on the definition of architecture and protocols for inter-provider roaming is ongoing in several standardization fora or industry initiatives (3GPP, ETSI, ECMA, IRAP …)

Spontaneous coalition access control investigates access mechanisms based on informally formed coalition scenarios. These informal coalition scenarios are strongly connected to particular contextual situations: for example communication sessions like calls, conferencing, and Instant Messaging (IM) or informal physical contacts that occur in meeting rooms, offices, and hallways. It
is not possible to establish traditional “formal” cross-organizational agreements within these spontaneous coalition encounters. Anyway, access to local resources still need to respect corporate access policies. The notion of spontaneous coalition access implies an increase in the number of un-verified access points and presents a serious security issue. User mobility, wireless connectivity and the widespread diffusion of portable devices raise new challenges for ubiquitous service provisioning. Devices that participate in spontaneous coalition scenarios can introduce “new” foreign services into the environment; due to their mobility these device can change location changing the availability of resources and services un-predictably. Access control to resources is crucial to leverage the provision of ubiquitous services and calls for novel solutions based on various context information, e.g., user/device location, device properties, user needs, local resource visibility.

Call for Submissions

The workshop is interested in contributions addressing areas associated with mobile and ubiquitous architectures, infrastructure, data and services as related to Ubiquitous Access Control. Under the “Ubiquitous Access Control” definition, we encompass both the “traditional” inter-provider roaming scenarios and the more advanced “spontaneous coalition” scenarios. The workshop will bring together the more “practical” aspects of the former scenario with the more advanced research aspects of the latter.

Technical papers describing original, previously unpublished research, are solicited. Tutorial paper or papers reporting experiences of deployed systems or demonstrators are also welcome. The papers cannot be currently under review by another conference or journal.

Topics include, but are not limited to the following:

- Integration of Contextual Models with Security Models.
- Coalition Access Control Models.
- Distributed Access Control Architectures and Models.
- Access Control and Trust Models for Ubiquitous Devices
- Group management for ad-hoc communities
- Peer discovery in Ubiquitous Computing Environment
- Architecture and protocols for inter provider roaming in wireless networks
- Experiences and test-beds for inter provider roaming

How to submit a paper

Paper submission is handled by the COCUS Conference Management System. In order to submit a paper you must first create a COCUS account.
- Go the COCUS web site: http://cocus.create-net.it/cocus/
- Click on Register. Once you have an account, login and click on Event List.
- Scroll down to International Workshop on Ubiquitous Access Control – IWUAC.
- Choose the Submit Paper Link.

As for the paper formatting guidelines, please refer to the workshop web page.
Co-organizers and TPC chairs:
Ramiro Liscano, University of Ontario, Oshawa, Canada
Stefano Salsano, University of Roma "Tor Vergata", Italy

Technical Program Committee

Selim Aissi, Intel Corporation, USA
Mahbubul Alam - Cisco Systems, San Jose, USA
Michel Barbeau - Carleton University, Ottawa, Canada
Tim Finin - University of Maryland, Baltimore County, USA
Patrick Hung - University of Ontario, Oshawa, Canada
Anupam Joshi - University of Maryland, Baltimore County, USA
Lalana Kagal - MIT, USA
Larry Korba - National Research Council, Ottawa, Canada
Markus Muck, Motorola Labs, France
Filip Perich - Shared Spectrum Company, USA
Anand Prasad - Docomo Eurolab, Munich, Germany
Neeli Prasad - Aalborg University, Denmark
George Prezerakos - Technological Education Institute of Piraeus, Greece
Fabio Ricciato - Telecommunications Research Center Vienna (ftw.), Austria
Simon Pietro Romano - Universita' di Napoli Federico II, Italy
Enrico Rukzio - Ludwig Maximilians University Munich, Germany
Michael Smirnov - Fraunhofer FOKUS, Germany
Nick Tselikas - National Technical University of Athens, Greece
Miquel Vargas - University of Ontario, Oshawa, Canada
Luca Veltri - University of Parma, Italy
Lixia Zhang - UCLA, USA
